

# How to use GetEmBernie

First of all, you want to execute GetEmBernie.exe to start the program.

You will then be asked once if you want to open DontStarveTogether from Steam , if it cant it will close the program [BROKEN for now, just choose No]

You will then reach the main option menu, where you can do 4 things:

1. Analyze players in a server you are not connected to
2. Analyze players in the server you are connected currently
3. Reload steamids lists
4. Solo Targeting mode

When i use the word “analyze”, what i mean is:

Saving the current profile steamid on the graylist if not present for future options  
Checking if the current profile steamid is on the blacklist, if it is present the program will show on screen the steamid of the griefer that is currently in said server

I will now explain how to use each option (except Exit option, surely you know what that does right?).

## Analyze players in a server you are not connected to

You will need to get in the correct scenario for this option to work, else it wont find any steam icons and wont click anything.

To reach said scenario:

A) click “Browse Games”

B) Click on the server you are intrested in analizing and wait for the “View Players” to be clickable, then click it

C) From this scenario showing the player list of the server, you can now use the option

If the scenario reached is right, the first option will be able to *supposedly* **analyze** every single steam profile of the current player list

If the scroll bar is present, make sure you use the option while the scrollbar is all the way up, to avoid skipping players at the top

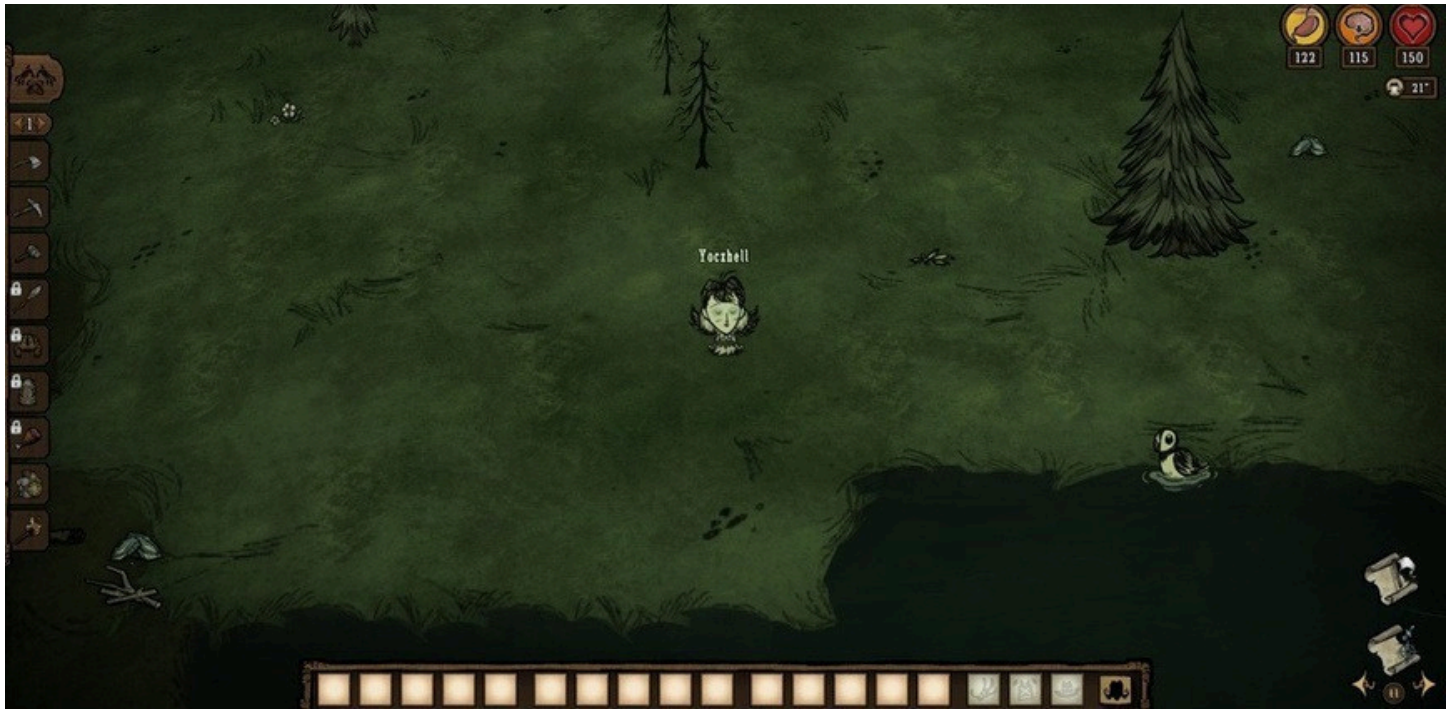

## Analize players in the server you are connected currently

You will need to get in the correct scenario for this option to work, else it wont find any character icons and wont click anything.

To reach said scenario:

A) join the game and choose a character, ideally stand complitely still including camera movement when using the option.

If the scenario reached is right, the second option will be able to *supposedly* **analize** every single steam profile of the current player list

Simply make sure that, when pressing TAB, if there is a scrollbar, its all the way to the top to avoid skipping players from the top

## Reload steamids lists

You use this option to make the program read the current graylist and blacklist.

You need to use this if:

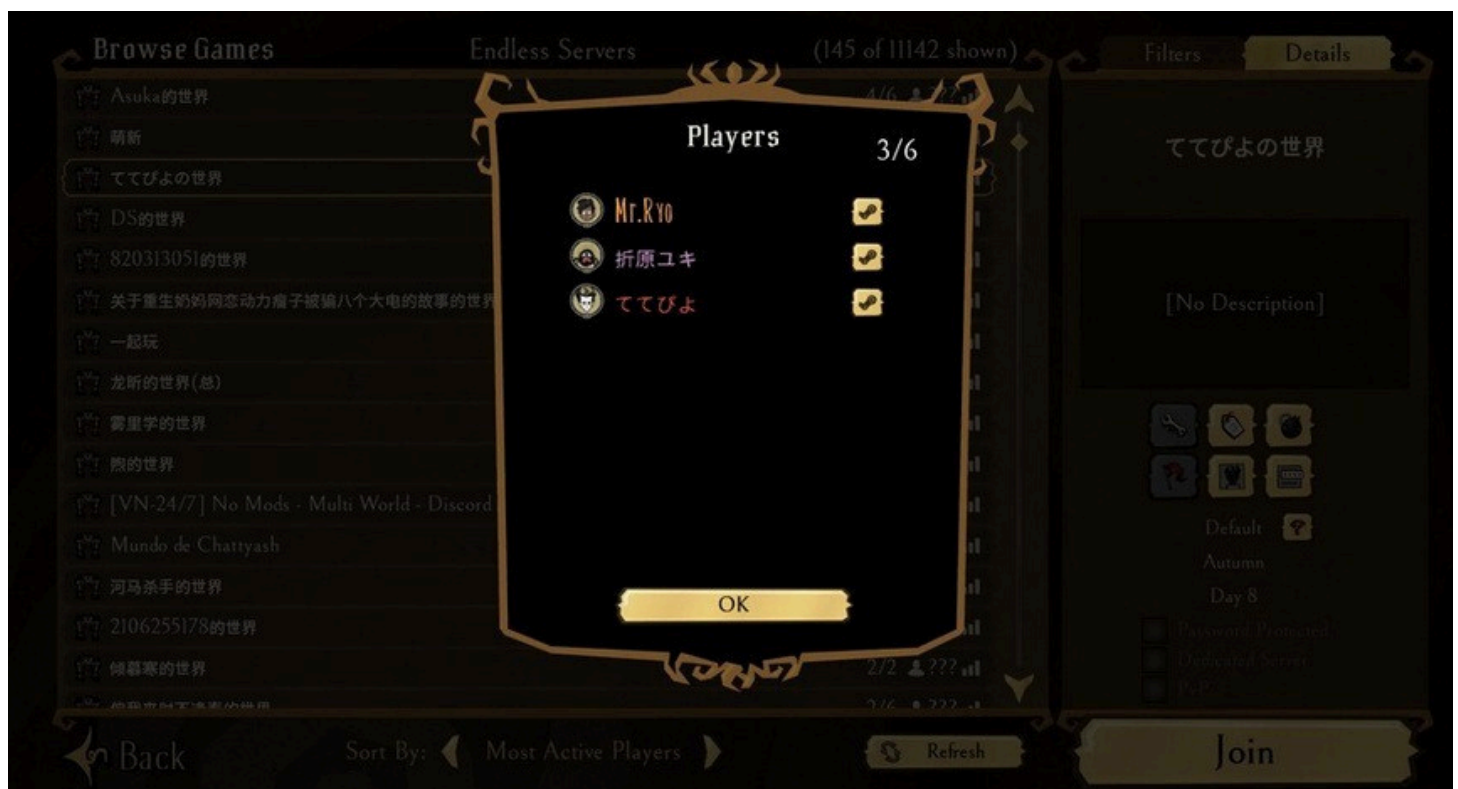

- You edited to add or remove one or more steamids to blacklist and want to use other options

## Solo Targeting

If you enable SOLO\_TARGETING (introduced in v0.1.1-beta) you will be able to analyze only 1 profile by simply hovering above the icon (to disable SOLO\_TARGETING, use the option again).

Depending on which option you choose:

1) To check a player from a server you are not connected to, you will have to be in the same scenario of the related option and hover your mouse over a steam icon 

2) To check a player from the server you are connected to, you will have to be in the same scenario of the related option , hold TAB and hover your mouse over a character icon 

## Download official warnlist

If you choose to download the official warnlist (introduced in v0.2.1-beta), you will be able to download (and overwrite) the current warnlist you are using, so you can have the latest version of reports and ids available. Be sure to reload lists right after just in case. Warnlist will now have a new format, having both steam profile and dedicated reporting page url to show past reports of said profile (if available)
